First Report of the Suicide Support and Information System

Dr Ella Arensman, Dr Carmel McAuliffe
Dr Paul Corcoran, Ms Eileen Williamson,
Mr Eoin O’Shea, Prof. Ivan J Perry

National Suicide Research Foundation

17th July 2012

The study was funded by the National Office for Suicide Prevention
Seminar Programme

12.00 noon
Welcome & Opening Remarks
Ms Eileen Williamson

12.10 pm
Address by Minister Kathleen Lynch TD
Launch by Minister Lynch of the two reports

12.30 pm
Presentation on the Suicide Support and Information System
Dr Ella Arensman

12.55 pm
Forum Discussion
Dr Carmel McAuliffe, Dr Brian Farrell, Mr Frank O’Connell
Mr Martin Rogan, Console Representative, ICGP Representative
Facilitator: Ms Eileen Williamson
Rapporteur: Dr Ella Arensman

1.25 pm
Presentation on Annual Report 2011 National Registry of Deliberate Self Harm
Dr Paul Corcoran, Dr Eve Griffin

1.50 pm
Forum Discussion
Dr Helen Keeley, Dr Siobhan MacHale, Ms Joan Freeman, Dr Daniel Flynn
Facilitator: Ms Susan Kenny
Rapporteur: Professor Ivan J Perry

2.20 pm
Concluding Statements
Why the Suicide Support and information System was developed?

- Need to improve early identification of suicide risk (risk factors and risk profiles).
- A minority of people who die by suicide (ca. 25%) are known to be in contact with mental health services in the year prior to their death. In obtaining a complete picture of suicide cases and risk factors it is therefore important to also involve other professionals and agencies, e.g. Coroners, GPs and Gardai.
- Need for more timely access to information on suicide deaths, increased accuracy of information on suicide mortality figures, and more insight into open verdict deaths.
- More information is required on individual and area-level characteristics associated with suicide clusters.
- Need for evidence-based information on suicide bereavement support interventions.
Chronology of the development of the Suicide Support and Information System

1st discussion of SSIS proposal with Dept. of Health and NOSP

- Consultations with stakeholders: Coroner Society of Ireland, Dept. of Justice, CSO, Gardaí, Health Services, Suicide Bereavement Support Services and National Confidential Inquiry into Suicide and Homicide, UK

2005

2006/2007

2008

2009 to date

- Obtained ethical approval,
- Obtained funding from NOSP for SSIS pilot study,
- Approval from the Coroners Society Ireland,
- Subcommittee of 3 Coroners established,
- Start SSIS

- Completion of SSIS pilot until March 2011,
- Independent evaluation,
- Completion of first SSIS report,
- Ongoing CORE SSIS data collection,
- Applications to maintain and expand SSIS
Suicide ca 550 p.a.

Deliberate self harm medically treated ca. 12,000 p.a.

“Hidden” cases of Deliberate self harm ca. 60,000 p.a.

SSIS objectives in line with priorities of Reach Out The National Strategy for Action on Suicide Prevention, 2005-2014

- Accuracy of suicide statistics
- Suicide risk identification
- Standardisation of suicide bereavement support
Suicide Support and Information System (SSIS): Objectives

**Objectives:**

1) Improve provision of support for the bereaved

2) Identify and better understand the causes of suicide

3) Identify and improve the response to clusters of suicide and extended suicide (e.g. filicide-suicide and familicide)

4) Better define the incidence and pattern of suicide in Ireland

5) Reliably identify individuals who present for medical treatment due to deliberate self harm and who subsequently die by suicide.
Suicide Support and Information System: Innovative aspects of the SSIS methodology: Combining objectives using a stepped approach

Coroner’s inquest concluded involving cases of suicide/open verdicts

**Step 1 - Support:**
SRP facilitates support for families bereaved by suicide/other sudden deaths after conclusion of inquest

**Step 2 - Research:**
SRP approaches next of kin and health care professional(s) after conclusion of inquest

SRP: Senior Researchers: Dr Carmel McAuliffe, Mr Eoin O’Shea
Innovative aspects of the SSIS methodology:
Obtaining a more complete picture of suicide cases
and open verdicts by accessing all relevant sources of information

GP/Psychiatrist/Psychologist

Coroners’ verdict records & Post mortem reports

Close family members/friends
SSIS Methodology
Information obtained on wide range of aspects

- Completion of checklist Coroner Service for each case of suicide and open verdict – Aspects: Socio-demographic, outcomes post-mortem incl. toxicology, mental and physical health, major life events and precipitating factors.

- Semi-structured interview with family informant or friend – Aspects: Situation around time of death, family and personal history, mental and physical health, treatment history, social network.

- Semi-structured questionnaire to be obtained from health care professional who had been in contact with the deceased prior to death – Aspects: Cause of death, mental and physical health, treatment history, use of medication, final contact with services prior to death.
Response rates SSIS pilot-study
Sept 2008 – March 2011

- Total number of consecutive cases on file: N=190
- 4.8% of the family members indicated that they did not wish to be approached further after having received the first letter
- Completion of checklist Coroner Service: 100%
- Interviews with family informants – Response rate: 66%
- Completion of questionnaire health care professionals: 78%
Pro-active facilitation of support for people bereaved by suicide

- Referral to bereavement support and other services after conclusion of inquest: 39.5% (47.6% already received support)

- After August 2010, pro-active facilitation of bereavement support could not be continued due to reduced funding. As a consequence, the uptake of support dropped to 6.1%

- Additional benefits of pro-active facilitation of support, e.g. identification of other vulnerable family members, reduce stigma around help seeking etc.
Men were over-represented among those who had died by suicide (80.8%). The average age was 37.6 years with men being significantly younger (35.5 years) than women (45.4 years).

Among the people who had died by suicide:
- 38.1% were unemployed
- 32.8% had been working in the construction sector.

Other frequently reported occupations: agricultural occupations, students, medical profession, business/commerce, educational sector and taxi drivers.

Over two-thirds were known to have experienced suicidal behaviour (fatal and/or non-fatal) by family members or friends at some point in their lives (68.3%).
Risk factors associated with suicide

- One third of the deceased had had psychiatric assessment
  - 61.1% were diagnosed with mood disorder
  - 12.9% were diagnosed with anxiety disorder
  - 9.4% diagnosed with alcohol dependence
  - 9.2% schizophrenia

- 45% had a history of self harm.
  - Of those, 52% had engaged in self harm 12 months prior to suicide,
    24% less than a week, and 12% less than a day.

- In the year prior to death, 81% had been in contact with their GP or a
  mental health service. Most people who contacted GP did so more than
  4 times.
Risk factors associated with suicide

- In the year prior to death, alcohol and/or drug abuse was present in 51.7% of the cases. Among those, 78.1% abused alcohol in the year prior to death, 34.4% abused both alcohol and drugs and 15% abused drugs only.
Negative and traumatic life events in the year prior to death and earlier in life
Identification of a suicide cluster

- The Suicide Support and Information System identified 19 cases of suicide by young men in a small area in Cork between 19th September 2008 – 19th December 2010.

- The age of the young men involved in the suicide cluster ranged from 14 to 36 years (mean age: 23 years).

- In all cases the method used was hanging.
## Development of a Suicide Cluster in Cork

### Date of Death

Suicide Rate: 350 per 100,000

DSH Rate: 591 per 100,000

Cork City
How was the cluster conveyed?

- None of the 19 cluster cases were reported in the media
- Based on evidence from coroner checklists and family informant interviews:
  10 of the 19 cluster cases (53%) were personally acquainted with at least 1 other case in the cluster
Comparison between suicide cluster cases and suicide cases not involved in a cluster

- The 19 suicide cluster cases were matched with non-cluster cases based on gender, age and suicide method.
- Common themes were obtained from the transcribed family informant interviews.
**Significant differences between suicide cluster and non-cluster cases**

</tbody>
</table>
Common themes related to the suicide cluster cases based on information obtained from family informant interviews

- Drug and alcohol abuse
- Undiagnosed, untreated mental health problems
- Difficulties at school, early drop-out, unemployment
- Lack of parental involvement, over-attachment to peers
- Violence and homicide
- Recurring suicides and effects of long term bereavement
- Lack of coherent services and lack of specialised counsellors
- Glorification of a young person who has died by suicide
- Distorted perception of death (lack of understanding of the finality of death)
## Characteristics of deaths classified as open verdicts (N=12)

| Characteristics related to cause of death           |            |
| **Cause of death**                                 |            |
| - Drowning                                         | 41.6       |
| - Hanging                                          | 25.0       |
| - Other causes/methods                              | 33.4       |
| **Alcohol consumed at time of death**               | 45.5       |
| **Left suicide note/e-mail/text message**          | 16.7       |

| Mental and physical health                          |            |
| **Presence of psychiatric diagnosis**               | 66.6       |
| **Primary psychiatric diagnosis:**                  |            |
| - Mood disorder                                     | 87.5       |
| - Other                                            | 12.5       |
| **History of one or more acts of deliberate self-harm** | 41.6   |
Implications

- A major benefit of the SSIS is the timely identification of emerging suicide clusters – significantly earlier than the Central Statistics Office.

- Therefore, the SSIS contributes to timely and enhanced postvention for communities affected by suicide, and suicide prevention.

- The SSIS obtains detailed information on suicides and open verdicts and therefore contributes to increased reliability of the incidence of suicide and suicide risk identification.

- The SSIS has established a unique interdisciplinary structure including Coroners, GPs, Gardai and mental health care professionals, facilitating both postvention and suicide prevention.
“If we are able to perceive the complexity of suicide as a challenge, we may be able to contribute ‘another piece to the jigsaw’ which we urgently need to complete”
